                       The invention relates to a monoclonal antibody (MAb) to lipoteichoic CC acid of gram positive bacteria, where the MAb is a chimeric cimmunoglobulin comprising at least part of a human immunoglobulin constant region and at least part of a non-human immunoglobulin variable constant region and at least part of a non-human immunoglobulin variable region having specificity to lipoteichoic acid of gram positive bacteria. The antibodies bind to whole bacteria and enhance phagocytosis and killing of the bacteria and enhance protection from lethal infection. The criming of the bacteria and enhance protection if the variable region of anti-lipoteichoic acid antibody or characterised by amino acids corresponding to one or more of the complementarity determining regions (CDRs) of the variable region of the antibody) can be used for treating corresponding infections caused by gram positive bacteria. They can also be used for the diagnosis of gram positive bacteria infections.

Sequences AAW94735-39 represent heavy chain variable regions of the anti-lipoteichoic antibody 96-100.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a monoclonal antibody (MAb) to lipoteichoic CC acid of gram positive bacteria, where the MAb is a chimeric immunoglobulin comprising at least part of a human immunoglobulin variable CC tensuant region and at least part of a non-human immunoglobulin variable CC region having specificity to lipoteichoic acid of gram positive bacteria. CC The antibodies bind to whole bacteria and enhance phagocytosis and CC tiling of the bacteria and enhance protection from lethal infection. The CC antibodies or peptides (encoded by a DNA of the variable region of CC anti-lipoteichoic acid antibody or characterised by amino acids CC corresponding to one or more of the complementarity determining regions CC (CDRs) of the variable region of the antibody can be used for treating CC or preventing infections caused by gram positive bacteria. They can also be used for the diagnosis of gram positive bacteria infections. CC Sequences AAW94735-39 represent heavy chain variable regions of the antibody 96-100.
                                                                                                                                                                                                                                                                                           Matches

                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                               cells with a tumour cell line; isolating the fused cells, culturing t and cloning positive hybrid cells; and screening the hybrid cells for prodn. of the required MAbs. The MAbs, bind to the gut of a target ins but do not bind to mammalian BBMs. The DNA sequence can be operably linked to a toxin molety, esp. selected from e.g. Bacillus toxins, pseudomonas exotoxin and phytolaccin, etc.. The Abs are useful for control of insect pests, e.g. Coleoptera, Diptera, Hymenoptera and
                                                                                                                                                                                                                                                                                                                                                                                                                       using insect guts, partic. insect brush border membranes (BBMs), esp. corn rootworm, as antigen; immunising a donor animal with the antigen; isolating immunocompetent B cells from the immunised animal; fusing B isolating immunocompetent B cells from the immunised animal;

The MAbs bind to the gut of a target insect but do not bind to mammalian BBMs. The DNA sequence can be operably linked to a toxin moiety, esp. selected from e.g. Bacillus toxins, Pseudomonas exotoxin and phytolaccin, etc. The Abs are useful for control of insect pests, e.g. Coleoptera, Diptera, Hymenoptera and Lepidoptera. The pesticidal compsn. is pref. applied to a plant, e.g.

CC (CCR2), comprising an antigen binding region of non-human origin CC and at least a portion of an immunoglobulin of human origin. The chumanised antibodies are useful for inhibiting the interaction of CC a cell expressing CCR2. They are useful for inhibiting or treating CCR introduced in the proteins of the invention are useful for inhibiting controduced in the proteins of the invention are useful for inhibiting controduced in the proteins of the invention are useful for inhibiting controduced in the manufacture of a medicament for treating cCR2 mediated discretes such as the controduced in the manufacture of a medicament for treating cCR2 mediated controduced in the manufacture of a medicament for treating cCR2 mediated controduced in the controduced controduced in the controduced con

                                                                                                                                                                                                          В
                                                                                                                                                                                                                              CC The present invention relates to a new method of inhibiting stenosis or CC restenosis of a blood vessel following vascular injury in a subject. The CC new method comprises administering to the subject agents which inhibit CC the adhesion and/or recruitment of neutrophils and mononuclear cells to CC a site of vascular injury by binding CD18 or CCR2. The method of the CC invention inhibits stenosis or restenosis of a blood vessel following CC vascular by-pass or transplantation surgery. The method is also useful CC for treating a subject having an inflammatory disease or condition CC mediated by neutrophil and mononuclear cell activity e.g. asthma and CC graft versus host disease. Chronic inflammatory diseases of the lung, CC collagen diseases, and insulin-dependent diabetes mellitus can also be treated. The method is further useful for treating inflammatory bowel CC diseases, such as ulcerative colitis. Additional diseases or conditions include inflammatory or aliergic diseases and conditions, including CC systemic anaphylaxis of hypersensitivity responses, drug allergies, CC psoriasis and inflammatory dermatoses, autoimmune diseases such as CC the present sequence represents the protein sequence of the mouse mab CC The present sequence represents the protein sequence of the mouse mab CC that can be used to inhibit stenosis or restenosis.

CC (CCR2), comprising an antigen binding region of non-human origin and at least a portion of an immunoglobulin of human origin. The CC humanised antibodies are useful for inhibiting the interaction of CC a cell expressing CCR2. They are useful for inhibiting or treating CC HIV infection. The proteins of the invention are useful for inhibiting CC leukocyte trafficking, for treating CCR2-mediated disorders such as CC inflammatory disorder, autoimmune disorders such as rheumatoid CC arthritis and multiple sclerosis, atherogenesis and atherosclerosis, and for inhibiting restenosis. They are useful in therapy or diagnosis, CC and for inhibiting restenosis. They are useful in therapy or diagnosis, CC and in the manufacture of a medicament for treating CCR-2 mediated CC disease. They are also useful for treating allergy, anaphylaxis, CC mediated allergic reaction, shock, stenosis, allograft rejection, CC fibrotic disease, asthma, inflammatory glomerulopathies, acquired commune deficiency syndrome (AIDS), restenosis associated with vascular CC intervention, including angioplasty and/or stent placement in a mammal. The communication of a vessel in a mammal, and inhibiting neointimal hyperplasia of the heavy chain variable (VIV) region of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Key

                                                                                                            versus host-companies a merinod of inhibiting graft rejection, graft versus host disease or chronic rejection of a transplanted graft. The method involves administering an antagonist of CC chemokine receptor 2 (CCR2) and optionally an immunosuppressive agent. The CCR2 antagonist may be an anti-CCR2 antibody (i.e. containing light and heavy chain complementarity determining regions from various non-human origins). CCR2 is known to be involved in the rejection of transplanted grafts. The method of the invention is useful for inhibiting graft rejection particularly allografts such as kidney, liver, lung, heart-lung, pancreas, bowel and heart. The method of the invention is also useful for inhibiting graft versus host disease and for inhibiting chronic rejection of a transplanted graft. The present amino acid sequence represents a mouse antibody heavy chain variable region (mAb 1D9).

                                            inflammatory disorder, autoimmune disorders such as rheumatoid arthritis and multiple sclerosis, atherogenesis and atherosclerosis, and for inhibiting restenosis. They are useful in therapy or diagnosis, and in the manufacture of a medicament for treating CCR-2 mediated disease. They are also useful for treating allergy, anaphylaxis, malignancy, chronic and acute inflammation, histamine and IgE-
                                                                                                                                        The patent discloses a humanised antibody or its antigen-binding fragment, having binding specificity for CC-chemokine receptor 2 (CCR2), comprising an antigen binding region of non-human origin and at least a portion of an immunoglobulin of human origin. The humanised antibodies are useful for inhibiting the interaction of a cell expressing CCR2. They are useful for inhibiting or treating HIV infection. The proteins of the invention are useful for inhibiting leukocyte trafficking, for treating CCR2-mediated disorders such as infection and the content of the invention are useful for inhibiting contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Key

                                                         Immunoglobulin comprising at least part of a human immunoglobulin constant region and at least part of a non-human immunoglobulin variable region having specificity to lipoteicholic acid of gram positive bacteria. The antibodies bind to whole bacteria and enhance phagocytosis and killing of the bacteria and enhance protection from lethal infection. The antibodies or peptides (encoded by a DNA of the variable region of anti-lipoteichoic acid antibody or characterised by amino acids corresponding to one or more of the complementarity determining regions (CDRs) of the variable region of the antibody) can be used for treating or preventing infections caused by gram positive bacteria. They can also be used for the complementarity determining treating the complementarity determining the comple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         intervention, including angioplasty and/or stent placement in a mammal. Humanised antibodies are also useful for inhibiting narrowing of the lumen of a vessel in a mammal, and inhibiting neointimal hyperplasia of a vessel in a mammal, preferably associated with vascular intervention. The present sequence is murine antibody 1D9 heavy chain variable region
Sequences AAW94735-39 represent heavy chain variable regions anti-lipoteichoic antibody 96-100.
                                      or preventing infections caused by gram positive bacterial infections be used for the diagnosis of gram positive bacterial infections
                                                                                                                                                                                                                                                                                                                                                                     Claim 21;

Inhibiting stenosis or restenosis of a blood vessel following vascular prinjury or angioplasty in a subject by administering agent which prinhibits recruitment or adhesion of neutrophils, mononuclear cells to prinjury site

XX

Thip present invention relates to a new method of inhibiting stenosis or crestenosis of a blood vessel following vascular injury in a subject. The crew method comprises administering to the subject agents which inhibit to the adhesion and/or recruitment of neutrophils and mononuclear cells to cascular injury by binding CD18 or CR2. The method of the such as consistent in procedure such as consistent by pass or transplantation surgery. The method is also useful consisted by neutrophil and mononuclear cell stock as treated by neutrophil and mononuclear cell activity e.g. asthma and collagen diseases, and insulin-dependent diabetes mellitus can also be treated. The method is further useful for treating inflammatory bewelf collagen diseases, such as ulcerative collis. Additional diseases or conditions cystemic anaphylaxis of hypersensitivity responses, drug allergies, processed and inflammatory dermatoses, and canthritis, graft rejection and other diseases including allergies, consists and inflammatory dermatoses, and other diseases including conditions of arthritis, graft rejection and other diseases including antheroscierosis. This sequence represents the variable region of one of several humanised confirmance.

CC This sequence represents the variable region of one of several humanised confirmance. In the production of anti-CCR2 antibody or antigen-binding the sequence. In the production of anti-CCR2 antibody or antigen-binding to the invention for the production of anti-CCR2 antibody or antigen-binding.

A27630
Ig heavy chain precursor V-10 region (MRL-DNA4) - mouse (fragment)
C; Species: Mus musculus (house mouse)
C; Date: 15-Dec-1988 #sequence_revision 15-Dec-1988 #text_change 23-Jul-1999
C; Caccession: A27630
R; Kofler, R.
J. Immunol. 140, 4031-4034, 1988
A; Title: A new murine Ig V-H gene family.
A; Reference number: A27630; MUID:88229103; PMID:3131427
A; Accession: A27630
A; Molecule type: DNA
A; Cross-references: GB:M21470; NID:g196220; PIDN:AAA38634.1; PID:g196221; GB:M
C; Superfamily: immunoglobulin V region; immunoglobulin homology
C; Keywords: heterotetramer; immunoglobulin homology <IMM>

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 18, Application US/08442542
Patent No. 5686600
GENERAL INFORMATION:
APPLICANT: Carozzi, Nadine B.
APPLICANT: Koziel, Michael G.
TITLE OF INVENTION: Antibodies which Bind to Insect Gut
TITLE OF INVENTION: Proteins and their Use
NUMBER OF SEQUENCES: 49
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Indels
